

A Playbook for Product Development in DeFi

Alim Khamisa
Product Manager, Element Finance

Oct. 13, 2022

The Role of a Product Manager in Four Words

Shape: Set the direction for the product bringing in key stakeholders to build a vision.

Ship: Coordinate requirements, UI/UX Design, and engineering efforts to deliver a great product.

Measure: Quantify product performance to measure against stated goals; focus on outcomes over output.

Synchronize: Interface with all team members to ensure alignment on requirements, timelines, roles and responsibilities, while ensuring accountability.

Building the Roadmap

R&D creates new opportunities

Will Villanueva
@wvjvill

Your senior smart contract engineers should be pushing the direction of your business and research.

They should be strong on economic design, have a meticulous eye for security, and strong at optimizing code, such as math libs, etc..

If you're hiring just coders, you're NGMI.

DeFi Teams Need a Strong Research Focus to Succeed

1. **Commit to experimentation** rather than simply rehashing existing solutions
2. **Take an additive vs. extractive approach**, contribute new primitives and leverage existing DeFi “lego pieces” in new ways
3. Have a **pipeline of research projects** that will contribute to protocol evolution and potentially new products

R&D driving the Product Roadmap

*R&D isn't the only input driving the Product Roadmap; for illustration purposes only

The **Now, Next, Later** approach to roadmapping is ideal for teams:

- in fast-changing environments like DeFi
- working on a new product (i.e., v1) that's in the early stages of development

Product Framework

Finding a process that works

High-Level Product Dev Process

Stage 0: Concept/Vision

Smart contracts (SC) team and Founders discuss concept

Stage 1: Formative

SC team discusses functionality with Frontend, Product & Design teams

Stage 2: Scoping + Prototype

Scoping, UI/UX, requirements, and project plan are hashed out

Stage 3: Development (sprints)

Sprint planning & execution
(1) SC & (2) FE

internal/external
stakeholder feedback

Agile Estimation is notoriously difficult

Measuring development velocity is key to achieving high performance

Poor task estimation leads to timelines slipping

Better estimation

1. **Time**
rough estimate of the time to complete the user story/task
2. **Collaboration Cost**
level of collaboration with other team members
3. **Confidence**
level of confidence in the time estimate and collaboration cost

Avoid blowing up your timelines with too many high-collab, low-confidence tasks in a single sprint.

Simulation-based Modeling

Validate Assumptions & Tune the Protocol

Simulation-based Modeling: Explore the 'what if' Questions

- Validate cryptoeconomic assumptions
- Tune key parameters in order to improve capital efficiency, fees, incentives, and risk
- Simulate interactions among actors to observe what macroscale effects emerge

Tools for Agent-based Simulation

Types of simulations that can be run include:

- Monte Carlo methods
- A/B testing
- Parameter sweeping

GAUNTLET

Token**SPICE**

EVM Agent-based Token Simulator
for Token Engineering

Product Market Fit + KPIs

A data-driven approach to measuring PMF

How do you know when you've attained PMF?

TVL? Sure, but there are problems

TVL is not necessarily sticky – traders look for the best yield opportunities across DeFi and may shift capital frequently

TVL is also subject to market cyclicalities and doesn't speak to the long-term sustainability of the protocol across various market regimes

TVL is not an ideal metric to measure **long-term** protocol health and success

Critical metrics to track

Ecosystem Engagement

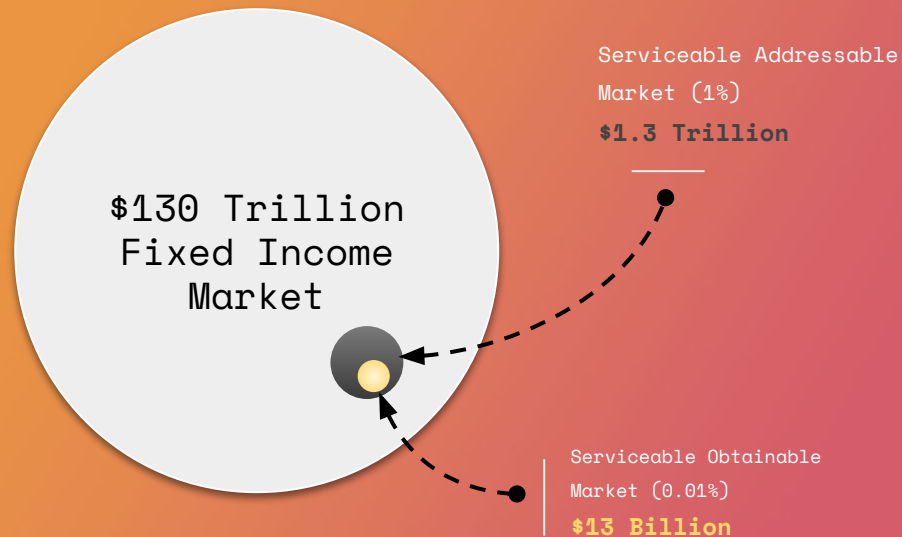

- Community engagement frequency and sentiment
- Developer activity
- Integrations
- # of unique token holders

Financial KPIs

- TVL
- Volume
- Revenue/TVL
- Market Cap/Revenue ...

Product Engagement

- DAUs / MAUs ↑
- Churn and Retention metrics
- User actions (deposit, trading, redeem, etc.)
- User activity by segment (retail vs. whales vs. institutional)
- Avg session duration
- Page-specific analytics (clicks, time on page, etc.)

Note: Figures for illustrative purposes only

Market Share as an Indicator of Product Market Fit

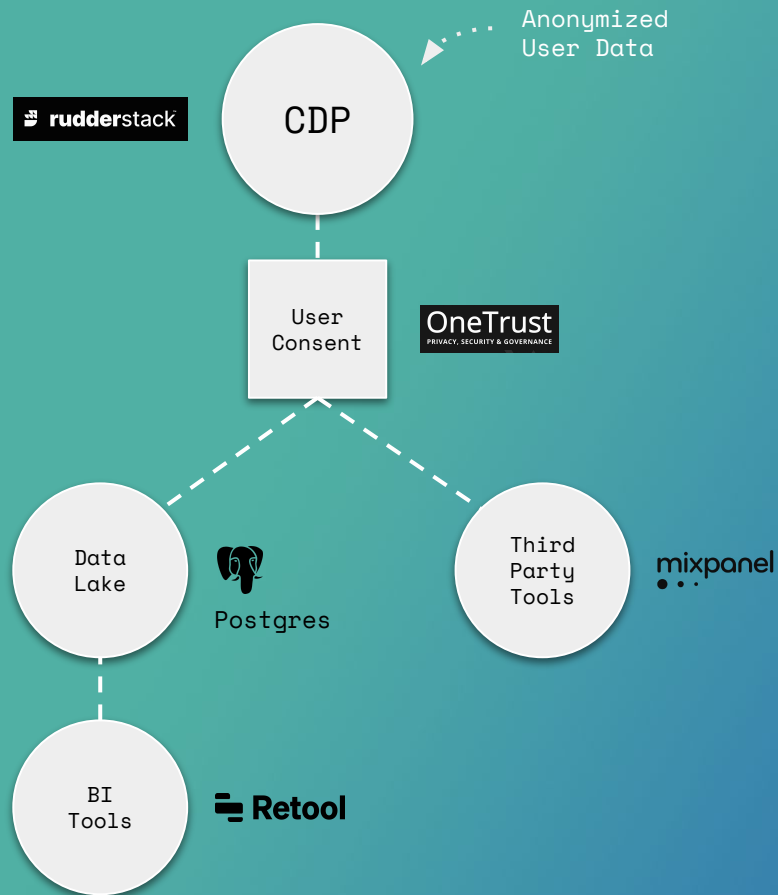

- What % of market share that you initially set out to capture have you captured?
- Both top-down and bottom-up approaches taken together can be more effective
- Consider CAGR of the space

Measure via Open-Source Tools with User Controlled Data

All major DeFi protocols (Maker, Aave, UniSwap, dYdX) **collect user data** to inform product decisions

Consent management allows users to opt-out of anonymous data collection

Open-source tooling can be used throughout **the stack** and can be housed by the team rather than third parties
